

FOR BANKS · PSPs · FINANCIAL INSTITUTIONS · FINTECHS

Digital Bank

A complete digital banking platform, built on Ghana's own rails — ready to run on your licence and your core.

What stands between an institution and a digital bank

A core that was never built for mobile

Adding a customer app to a legacy core usually means rebuilding around it, or waiting on the vendor.

Rails that each need their own integration

Mobile money, GIP, cards and QR arrive as separate projects, separate reconciliations, separate failures.

Decisions nobody can explain

A fraud model that declines without a reason is a complaint, a regulator question and a lost customer.

Months before anything is live

Building ledger, rails, onboarding and staff tooling from scratch is a long programme before the first customer.

One platform, end to end

Customer app and online banking

Mobile and web, onboarding to transfers, one login.

Double-entry ledger

Every movement balanced, reconciled daily against the core.

Payment rails

Mobile money, GIP, GhQR, cards and instant on-us, behind one API.

Mambu core integration

Your core stays the book of record; postings flow through an outbox.

Explainable fraud decisions

Every payment scored, every decline carries a reason.

Staff consoles

A reviewer queue and a live control tower, behind their own login.

Every Ghanaian rail, one integration

RAIL	WHAT IT DOES	STATUS
Mobile money	MTN, Telecel, AirtelTigo and Glo — collect and disburse, with the customer approving on their phone	Sandbox Hubtel-ready
GIP interbank	Name enquiry before every transfer; the session travels through to settlement	Sandbox GhIPSS-ready
GhQR	Scan to pay at any till; EMVCo-compliant parsing with checksum verification	Sandbox
Cards	Visa and Mastercard linked by token — no card number is ever stored	Sandbox
On-us	Both accounts credited and debited at once, visible immediately	Live

Your core stays the book of record

Built to the Mambu v2 contract

Version-negotiated requests, UUID idempotency keys, and an in-flight retry treated as in flight — never as a second payment.

Postings through an outbox

Settlement writes the ledger first and queues the core posting, so a slow core never loses or doubles money.

Reconciled every day

Account balances are checked against the ledger; any break surfaces in the control tower, not in a customer complaint.

Every automated decision carries a reason — or goes to a person

Each use case carries a published confidence floor and a data-protection reference. Held money stays the customer's until a person clears it.

Operations can see and act on everything

Reviewer console

- Held payments, identity checks and disputes in one queue
- A 30-minute service level, with breaches flagged
- Approve, reject or escalate, each with a reason on record
- Keyboard-first, built for a full shift

Control tower

- Payments this hour and value settled today
- Every rail probed, with its latency
- Postings waiting on the core, and any that failed
- Reconciliation breaks the moment they appear

A customer journey that respects the customer

01

**Open with a
phone number**

02

Set a PIN

03

**Verify with the
Ghana Card**

04

**Account
number issued**

05

**Send — name
checked first**

06

**Scan to pay at
any till**

Local numbers as people write them — 024, 054, 027, 050 — every network. The account number is issued only after identity clears, which is the order a bank opens accounts in.

Built to the standard a regulator will ask for

Money movement is idempotent

A retried request can never move money twice

No card numbers held

Scheme tokens only, which keeps the platform out of card-data scope

Staff tools behind their own login

Separate from customer sessions

Double-entry, reconciled daily

Every pesewa balances, and breaks are surfaced

An audit record on every staff action

Who decided, when, and why

Held funds remain the customer's

Nothing moves until a person clears it

Who it is for, and what each gets

INSTITUTION	WHAT YOU GET
Banks	A digital channel on your licence and your core, without rebuilding either
Payment service providers	Ledger, reconciliation and a customer app around the rails you already run
Savings and loans, microfinance and rural banks	A modern mobile bank without an in-house engineering team
Fintechs	The governance, audit trail and staff tooling a partner bank will require

Your licence.
Your core.
Our platform.

You keep the customer relationship and the regulatory standing. We provide the working bank around them.

How we would work together

PHASE 1 · [__ weeks]

Discovery and sandbox

Your team uses the platform on sandbox rails; we map your core, products and limits.

PHASE 2 · [__ weeks]

Integration

Connect your core, your rail credentials and your branding; run your acceptance tests.

PHASE 3 · [__ weeks]

Pilot and launch

A controlled pilot with real customers, then a phased launch.

Commercial model: [licence · per active account · revenue share — to confirm]

Where it stands today

Live

Running at pokzbank.org, with the app, online banking and both staff consoles

148

Automated checks across the server, the customer screens and the staff consoles, run on every change

Sandbox

Every external rail is built and tested against sandbox behaviour

Going to production is configuration, not rebuilding: Hubtel, GhIPSS and Mambu credentials, operated under a Bank of Ghana–licensed partner.
